

**DataCarer** is a comprehensive Care Administration database catering for the needs of both care homes and non-residential establishments. It provides all the specialised functionality you need to effectively manage a care facility, and supports important regulatory requirements.

### Service Users & Contacts

Keep full details of all your service users, past, present and prospective. See at a glance the status of all their related information such as assessments and outstanding activities.

### Care Guide

DataCarer allows you to maintain a customised care planning framework. You can formulate assessments using questionnaires, standardising responses to assessments, and ensuring consistency.

### Assessments & Care Plans

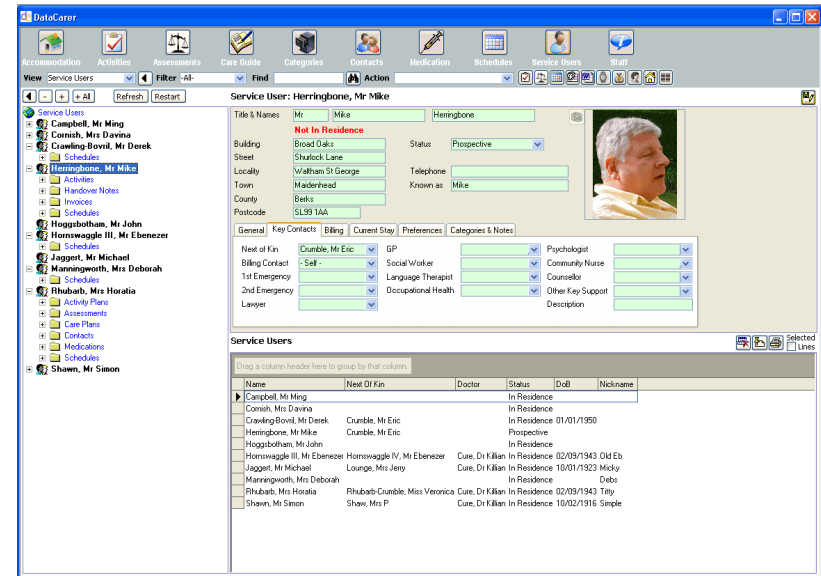

Gather details of service users' needs, outcomes, actions and goals, and score according to your personalised guidelines. Record multiple categorised assessments, and include as appropriate in the Care Plan.

### Accommodation, Funding and Billing

Record residential stays, and calculate bills according to fee scales and billing frequencies. Identify funders, funding rates & periods, automatically crediting the service user, and raising invoices (when due) to funders. And all this in one operation! Then print invoices and post them into your accounting system.

### Activities

DataCarer keeps all To-Do items as Activities, linked to staff records, service users, assessments etc. Resident activities can be generated according to a schedule, billed and funded, giving an effective solution for domiciliary care.

### Simple & Easy to Learn

The interface is straightforward and consistent throughout the package, simplifying end-user training. Records can easily be found using the explorer-style views. You can also create user-defined categories for many kinds of records, and view them together.

### Cost-Effective

Contact us for the latest information on pricing, including special savings on our all-inclusive hardware, software, installation and training package.
